Assay labels, part $\mathcal{A}$
(one variant per residue)
Per-class thresholds
$\hat{t}_0, \hat{t}_1$ (miss rate $\leq \alpha$)
Assay labels, part $\mathcal{B}$
(one variant per residue)
Certify likelihood ratios
(exact, after selection)
Target variants
(e.g. VUS), no labels
Mixture check: target
vs. the classes of $\mathcal{A}$
Calls on the score axis
functional
abstain
LoF
$\hat{t}_0$
$1 - \hat{t}_1$
each call type has a
certified likelihood ratio
for the assay outcome
